

Case Study

Persimmon is the UK's leading house builder, constructing 12,000 homes a year over 400 sites. Established for over 30 years, Persimmon offers the greatest number of homes in quality areas throughout the UK and has over 30 regional offices from Exeter to Edinburgh. The company builds a wide range of properties including bungalows, semi-detached, detached homes as well as luxury apartments.

The Requirement

Persimmon had undertaken a project to build a third server room as part of the Company's growth. Their continued expansion inevitably meant an increase of their IT requirements and a new UPS system was an integral part of the project. IT Manager Julie Pullan began the search to find a reliable supplier and was recommended to contact UPS Systems by their Software Developers, who were existing customers of UPS Systems.

As a critical corporate resource it was essential that the correct solution was found. UPS Systems' Account Manager Melvyn York, reviewed the technical specification and ratings for the new server room in order to put forward solutions that would provide the best possible security and back up.

Persimmon selected the Riello Galatrek Multi Dialog 30kVA which is perfectly suited to critical applications. The key feature of the Multi Dialog is its reliability. The input and output filters protect the load from mains disturbances and surges, even on bypass. It offers full microprocessor control, superior battery reliability and advanced communications.

“ UPS Systems were recommended to us and we have not been disappointed. The staff were informative and helpful and our enquiry was handled efficiently. We are very pleased with the service and solutions they provided. ”
