

Minimise downtime thanks to improved resilience, reducing your risk of system failure.

Optimise performance through enhanced efficiency, cutting needless waste along with your energy bills.

Maximise budget by extending your UPS's overall life, lowering your total cost of ownership (TCO).

Emphasise effective future-planning by proactively scheduling any necessary component replacements.

BREATHE NEW LIFE WITH A UPS OVERHAUL

An overhaul extends the lifespan of your UPS and gives it a performance boost by proactively replacing aging fans and capacitors.

UPS capacitors age over time and can cause problems such as harmonics and damage your battery strings.

While **fans** keep your rectifier and inverter cool enough to operate safely. But they're prone to failure, which exposes key components to higher temperatures and speeds up deterioration.

Proactively replacing old fans and capacitors with new lengthens the service life of your UPS, reduces your risk of failure, and puts off a far more expensive full replacement.
