

UPS OVERHAULS

Minimise downtime thanks to improved resilience, reducing your risk of system failure

Optimise performance through enhanced efficiency, cutting needless energy waste

Maximise budget by extending your UPS's overall life, lowering your total cost of ownership (TCO)

Emphasise effective future-planning by proactively scheduling replacement components

What's The Benefit?

Overhauls extend the lifespan of your UPS and boost its performance by replacing any ageing fans and capacitors.

Fans keep the rectifier and inverter cool enough to operate safely. Faulty fans subject these parts and others to higher temperatures, making them deteriorate far quicker.

Capacitors improve your UPS's power quality. But even if 1 or 2 are nearing their end of life, that's unnecessary stress on your system.

Under-performing capacitors cause issues with harmonics and damage battery strings, while serious failure exposes your load to unstable power.
